## The NASA STI Program Office . . . in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program Office plays a key part in helping NASA maintain this important role.

The NASA STI Program Office is operated by Langley Research Center, the Lead Center for NASA's scientific and technical information. The NASA STI Program Office provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program Office is also NASA's institutional mechanism for disseminating the results of its research and development activities. These results are published by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA's counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or cosponsored by NASA.
- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services that complement the STI Program Office's diverse offerings include creating custom thesauri, building customized databases, organizing and publishing research results . . . even providing videos.

## **Summary**

A fan concept was previously identified that would meet the NASA aeronautics goal of a 20 EPNdB reduction in aircraft noise. This was a 2-stage fan with a pressure ratio of 1.15 and a 460 ft/sec tip speed. The 2 stages were identical so that, with the proper synchrophasing, noise from one stage could be used to cancel noise from the other stage. This paper documents the aerodynamic design of the 2-stage fan concept in a 22-in. diameter size for testing in the NASA Glenn 9- by 15-ft wind tunnel. A set of rotor and stator coordinates are listed in the report. Stress and flutter analyses were done on these blades and showed that the design was structurally viable. A noise prediction code, using the blade coordinates and fan flows, indicated that the 2-stage fan would meet the goal of a 20 dB reduction in fan noise.

## **Introduction**

In 1997 NASA published its goals for aeronautics research. Among these goals was the reduction of aircraft noise. Specifically, the goal was to “reduce the perceived noise levels of future aircraft by a factor of two from today’s aircraft within 10 years and by a factor of four within 20 years.” A factor of two reduction is about 10 Effective Perceived Noise Decibels and four is 20 Effective Perceived Noise Decibels. Part of the technology needed to reduce aircraft noise is the reduction of engine noise. This requires both the reduction of the jet noise from the engine and the reduction of the noise generated by the engines fan stage.

A fan concept to achieve the 20 dB Effective Perceived Noise Level reduction was identified in reference 1. This fan concept built upon noise reduction technology from the Advanced Subsonic Technology (AST) program, which indicated a 10 dB reduction potential. The AST technology fan combined the basic characteristics of the Pratt & Whitney ADP Fan 1 (ref. 2) with the swept exit guide vanes of an Allison Engine Company fan (ref. 3). The new fan concept used the AST fan as a base fan and was configured to provide an additional 10 dB noise reduction beyond the AST fan resulting in the 20 dB total reduction goal.

The new fan concept had a pressure ratio of 1.15 to enable the necessary jet noise reduction and required a tip speed at or below 530 ft/sec to obtain the fan noise reduction. This low tip speed would not

support the 1.15 pressure ratio so the fan concept developed into a two-stage fan. This two-stage fan concept from reference 1 is illustrated in figure 1. The fan concept consists of two fan stages with 460 ft/sec tip speed. The tip speed was lowered to account for the extra noise of two stages as opposed to a single stage fan at 530 ft/sec. The pressure ratio of each stage is 1.072 for an overall pressure ratio of 1.15 at the exit from the two stages. For further noise reduction the concept includes large spacing between fans and between the blade rows in each fan. The concept has the fans being driven from different spools of the engine giving the ability to synchrophase the rotors such that the noise from one stage can be used to cancel the noise from the other stage. The stators are swept for noise reduction and acoustic treatment is applied to the inner and outer flow path walls.

Since both the Pratt & Whitney ADP Fan 1 (ref. 2) and the Allison Fan (ref. 3) were both acoustically and aerodynamically tested in 22-in. diameter size in the NASA Glenn 9- by 15-ft wind tunnel, it was decided to proceed with a design of the fan concept in this size for possible future testing in the same facility. This paper documents the aerodynamic design of this fan concept and presents the results of acoustic predictions using the aerodynamic design parameters.

## **Internal Fan Flow**

The internal flow through the fan was modeled using a 2-D strip-wise method (ref. 4). The model has 11 streamlines from hub to tip. The inner and outer flow path walls in the fan duct were constant radius so the two fan stages could be identical for noise cancellation purposes. The inner radius was 5.5 in. and the outer radius was 11 in. yielding a hub to tip ratio of 0.5. Since each of the fans was to be identical only one fan design was calculated. The results of the calculation for the one fan stage are included in appendix A.

In this design, each of the rotors has 22 blades and each of the stators has 12 long-chord vanes. A sketch of the two stages in the duct is shown in figure 2. This sketch is a side view of the passage, so the twist of the rotor blades makes them appear as trapezoids despite the fact that they have a constant chord from hub to tip. The basic parameters of the fan design are shown in table 1. A 3-D sketch of the 2-stage fan gives a better illustration of the design and is included in figure 3. Figure 4 shows span wise variations of some of the rotor parameters. Figure 4(a) shows the rotor inlet relative Mach number, figure 4(b) the maximum thickness to chord ratio (the chord is a constant 3.2986 in. from hub to tip) and figure 4(c) the diffusion factor.

A 3-D analysis (refs. 5, 6, and 7) was also performed on the finalized fan stage. Some hub to tip contours of the total temperature, total pressure and adiabatic efficiency are shown in figure 5. These contours show how well the design met the objectives and how well the 2- and 3-D analysis compare. Based on these analyses, the 2-stage fan should meet the objective of a 1.15 pressure ratio at 460 ft/sec tip speed.

## **Blade Coordinates**

To accomplish the flow parameters indicated in the previous section, blade coordinates were calculated for the rotor and stator blades. These coordinates are specified as in figure 6. A list of the blade coordinates, in plot 3-D format, is found in appendix B. These coordinates specify the “hot running” shape of the rotor blades. The actual cold, manufacturing coordinates have not been calculated. However, with the low tip speed of the blades, the amount of untwist during operation is very small, probably less than one degree (based on the preliminary analysis). If this is the case, then it may be possible that no corrections to these “hot running” coordinates are necessary.

## **Stress and Flutter Analysis**

A preliminary analysis of the stress for the 2-stage fan was performed using MSC/NASTRAN. This analysis included: the zero speed frequencies and mode shapes for both the rotor and stator—at speed frequencies for the rotor; Campbell diagrams for the rotor and stator—stresses and deflections for the rotor at operating and maximum speed. In addition, reduced frequency flutter parameters were calculated. The detailed analysis, done for one stage since the stages are identical, is included in appendix C. The rotor was modeled as being constructed of Ti-6Al-4V titanium and the stator of carbon steel.

The blades were shown to be acceptable for the intended use with the rotor having a factor of safety on yield of 15 at operating conditions and 10 at maximum speed. In addition all the calculated reduced frequency flutter parameters were above the generally accepted limits.

## **Nacelle**

A nacelle, designed to be similar to the one used for the Pratt & Whitney ADP Fan 1 (ref. 2), was designed for the 2-stage fan. The coordinates for this design are included in appendix D. A sketch of the nacelle is shown in figure 7 with the x-axis starting at the stacking line of the first rotor and the r-axis measured from the centerline of the fan. The nacelle inlet and spinner bring the airflow to the internal flow path of the fan design (appendix A) with an inner radius of 5.5 in. and an outer flow path radius of 11 in. These radii are then constant through the two fan stages.

The nacelle inlet exterior starts at the inlet lip and continues to a constant radius of about 13.3 in. The length of this nacelle as shown in appendix D was a nominal number. Since the internal and external radii are constant over the fan stage, this nacelle can be shortened or lengthened with the substitution of cylindrical sections.

A CFD analysis was performed on the nacelle and the design was judged to be acceptable. The nacelle inlet was calculated as having an inlet pressure recovery of 0.9989 while flowing an inlet mass flow of 42.65 lbm/sec. This nacelle design would then be used for the 2-stage fan when mounted in the 9- by 15-ft wind tunnel.

## **Acoustic Prediction**

The VO72 code (ref. 8) was used to predict the tone and broadband noise for the ADP Fan 1 and for one stage of the 2-stage fan. These predictions gave fore and aft power levels for the two fans. Since the aft power levels were greater than the inlet power levels for both fans, the aft powers were used to estimate the noise reduction of the 2-stage fan. To arrive at comparable spectra, corrections were applied to the single stage numbers for the 2-stage fan. Since the prediction was made for only one stage a 3 dB addition was added to account for the second stage. In addition, no prediction was made for the interaction of the first stage stator wakes and turbulence with the second stage rotor. Since this noise would have to propagate out through blade rows in each direction it was felt that it would be conservative to say this source would produce less noise in the far field than that produced by a single stage. Therefore it would be conservative to model this interaction as another stage so this added another 1.8 dB to the 2-stage fan level (3 stages, add 4.8 dB). In addition, because of the lower thrust of the 1.15 pressure ratio 2-stage fan, calculated to be approximately 40 percent of the ADP thrust with both at the same diameter, another 4.2 dB was added to the 2-stage value. For purposes of computing a perceived noise level comparison of the two fans, a 6-ft diameter size was chosen. Figure 8 shows a comparison of the predicted aft power spectra for a 6-ft diameter fan after the previously mentioned corrections were

applied. The ADP fan blade passing tone is cutoff and therefore does not appear on the plot. When a PNdB comparison of the two predictions was made, the 2-stage fan was 13 PNdB quieter than the ADP fan. This prediction is without any benefit of the noise cancellation possible by synchrophasing the two fan stages. This more detailed prediction corroborates the rule of thumb philosophy used in reference 1 and indicates that the 2-stage fan would be at least 10 dB below the AST fan. With the 2-stage fan being at least 10 dB below the AST fan, its total reduction would meet the 20 dB reduction desired by the aeronautics noise goals.

## **Concluding Remarks**

A fan concept was previously identified that would meet the NASA Aeronautics goal of a 20 EPNdB reduction in aircraft noise. This was a 2-stage fan with a pressure ratio of 1.15 and a 460 ft/sec tip speed. The 2 stages were identical so that, with the proper synchrophasing, noise from one stage could be used to cancel the noise from the other stage.

Previous fans in the AST noise program have been tested in 22-in. diameter size in the NASA Glenn 9- by 15-ft wind tunnel. This paper documents the aerodynamic design of the 2-stage fan concept in the 22-in. diameter size for testing in this facility. The internal flow through the fan, designed with a 2-D strip code and checked with a 3-D viscous code, is presented in this paper. A set of rotor and stator blade coordinates to provide these flows were calculated and are listed in the report. Stress and flutter analyses were done on these blades and showed that the design was structurally viable. A fan nacelle, based on a previously tested nacelle, was designed for the 2-stage fan and the flows checked with a CFD code.

The blade coordinates and fan flows were used in a noise prediction code to predict the levels of this 2-stage fan. The results of this code indicate that the 2-stage fan would meet the goal of a 20 dB reduction in fan noise.

## Appendix B Blade Coordinates

1. Rotor blade followed by stator vane
2. 21 sections proceeding from hub to tip
3. 101 points per section with both no. 1 and no. 101 at blade trailing edge
4. All x-coordinates listed first, then all y and z (plot 3-D format)

### Rotor

## Appendix C Stress Analyses

Structural analyses of the 2-stage fan rotor and stator designs were completed. All analyses were completed using MSC/NASTRAN. The results of the analyses include:

1. Zero speed frequencies and mode shapes for both the rotor and stator
2. At speed frequencies for the rotor
3. Campbell diagrams for the rotor and stator
4. Stresses and deflections at operating speed (4792 rpm) and maximum speed (6000 rpm) for the rotor
5. Reduced frequency flutter parameters

The finite element model of the rotor is shown in figure C-1. The base of the rotor is assumed to be fixed. Material properties for titanium (Ti-6AL-4V) were used for the analyses.

The zero speed mode shapes and frequencies for the titanium rotor are shown in figure C-2. The Campbell diagram for the rotor, including the frequencies at operating speed, is shown in figure C-3.

Displacement and stress analyses were performed assuming the base of the blade is fixed. Only rotational loading is applied.

Displacement for the rotor at 4792 rpm is shown in figure C-4. Maximum tip deflection is 0.016 in. Maximum principal stress for the rotor at 4792 rpm is shown in figure C-5. Maximum stress is 8050 psi at the base of the blade. The yield strength for the titanium is 126000 psi giving a factor of safety on yield of 15.

Displacement for the rotor at 6000 RPM is shown in figure C-6. Maximum tip deflection is 0.024 in. Maximum principal stress for the rotor at 6000 RPM is shown in figure C-7. Maximum stress is 12600 psi at the base of the blade. The yield strength for the titanium is 126000 psi giving a factor of safety on yield of 10.

The finite element model of the stator is shown in figure C-8. The base and tip of the stator are assumed to be fixed. Material properties for carbon steel were used for the analyses. The zero speed mode shapes and frequencies for the carbon steel stator are shown in figure C-9. The Campbell diagram for the stator is shown in figure C-10.

The reduced frequency flutter parameters were calculated. They are summarized in table C-1. All calculated frequency flutter parameters are above the generally accepted limits.

Table C-1.—Reduced frequency flutter parameters.

| Mode           | Frequency,<br>$\omega$    | Chord length,<br>$c$ | Velocity,<br>$V$ | $\omega c/V$ |
|----------------|---------------------------|----------------------|------------------|--------------|
| First bending  | 350.6 hz/2202.9 rad/sec   | 3.3 in.              | 4830 in./sec     | 1.5          |
| Bend/torsion   | 1154.8 hz/7255.8 rad/sec  | 3.3 in.              | 4830 in./sec     | 4.9          |
| First torsion  | 1741.7 hz/10943.4 rad/sec | 3.3 in.              | 4830 in./sec     | 7.4          |
| Second torsion | 2702.0 hz/16977.2 rad/sec | 3.3 in.              | 4830 in./sec     | 11.5         |

Reduced frequency flutter parameter =  $\omega c/V$

where

$\omega$  = zero speed frequency

$c$  = chord length at 75 percent span

$V$  = air inlet velocity at 75 percent span

Limits:

bending mode,  $\omega c/V > 0.33$

torsion mode,  $\omega c/V > 1.66$

Rotor model  
 Base fixed  
 4792 rpm operating speed  
 6000 rpm maximum speed

Titanium  
 $E = 16 \times 10^6$  psi  
 $\nu = 0.31$   
 $\rho = 0.160$  lb/in.<sup>3</sup>

| 13. ABSTRACT (Maximum 200 words)<br><br>A fan concept was previously identified that would meet the NASA aeronautics goal of a 20 EPNdB reduction in aircraft noise. This was a 2-stage fan with a pressure ratio of 1.15 and a 460 ft/sec tip speed. The 2 stages were identical so that, with the proper synchrophasing, noise from one stage could be used to cancel noise from the other stage. This paper documents the aerodynamic design of the 2-stage fan concept in a 22-in. diameter size for testing in the NASA Glenn 9- by 15-ft wind tunnel. A set of rotor and stator coordinates are listed in the report. Stress and flutter analyses were done on these blades and showed that the design was structurally viable. A noise prediction code, using the blade coordinates and fan flows, indicated that the 2-stage fan would meet the goal of a 20 dB reduction in fan noise. |   |  |  |  |
